

OperatorOS

MSPs / INTERNAL IT / FIELD ENGINEERS

TechDeck

Resolve it. Explain it. Prove the work.

Turn service work into a record
your team can stand behind.

A BETTER WAY TO OPERATE

SHOTGUN NINJAS PRODUCTIONS / 05 OCTOBER 2026

The fix is only half of the service.

01

Context is scattered

The ticket says what broke. The system details and last attempt are somewhere else.

Time goes into reconstruction.

02

The handoff is thin

“Resolved” hides failed attempts, side effects and the checks still outstanding.

The next engineer starts over.

03

The explanation is late

A client challenges the change or invoice. Evidence has to be assembled after the fact.

Confidence becomes fragile.

From client risk to a defensible closeout.

THE RECORD YOU KEEP

Leave a service record that explains what happened, what changed and what still needs attention.

Your core workflow. One OperatorOS home base.

One flagship per organization. Expand with the eligible companions your team needs.

Built around the engineer's actual work.

01

Run service delivery

Tickets, assignment, service time, recurring work, portal updates and status history.

02

Keep system context

Clients, sites, configuration items, network/IP records and lifecycle facts.

03

Control the procedure

Versioned documents, review states and technician-guided runbooks.

04

Retain resolution evidence

Structured closeouts with source revisions, warnings, failures and validation.

05

Find and reuse the fix

Exact and full-text retrieval; evidence-derived KB and runbook drafts.

06

Show the work

Reports, protected attachments, activity history, scoped APIs and signed webhooks.

Put service risk and its context together.

The workday brief points the team to recorded risks and the source records needed to act.

A ranked service view grounded in recorded facts.

- 
- 01 Overdue ticket**
Open the work that needs attention.
 - 02 Critical / unassigned**
Make ownership the next decision.
 - 03 Critical / offline record**
Review the affected configuration item.
 - 04 Lifecycle / procedure**
Check what is due or waiting for review.

WORKFLOW DIAGRAM / ILLUSTRATIVE

"You touched it. Now it is broken."

THE MOMENT

After a configuration change, a client reports a new fault and asks the MSP to explain what happened.

- 1 Establish context**
Link the client, ticket and affected system.
- 2 Retain the record**
Capture the baseline, authorization reference and external execution output.
- 3 Validate**
Record the exact checks, results and unresolved work.

WHAT THE TEAM CAN SHOW

An attributable sequence of evidence and decisions.

MEASURE / Time to reconstruct the change for client review.

The next shift skips the archaeology.

THE MOMENT

A recurring VPN issue lands with an engineer who did not work the original incident.

- 1 Retrieve**
Search the recorded identifier and incident narrative.
- 2 Inspect**
Review failed attempts, side effects, warnings and pending validation.
- 3 Continue**
Use linked knowledge and retain the next action with an owner.

WHAT THE TEAM CAN SHOW

A useful starting point with the source still attached.

MEASURE / Minutes from assignment to a defensible next action.

A good fix becomes a reviewed procedure.

THE MOMENT

The team keeps solving the same fault, but the useful knowledge stays with one senior engineer.

- 1 Review evidence**
Check what worked, what failed and what was actually verified.
- 2 Create the draft**
Preview a KB or runbook assembled from the recorded incident.
- 3 Approve and reuse**
Edit, review and publish with source links and access controls.

WHAT THE TEAM CAN SHOW

A versioned procedure with evidence behind its guidance.

MEASURE / Repeat incidents with a usable reviewed procedure.

Open the ticket. Follow the evidence.

01

Set the context

Open one client, affected item and ticket.

02

Record the work

Show the procedure, service time and evidence.

03

Inspect the closeout

Review failed attempts, checks and open follow-ups.

04

Reuse the lesson

Find the incident and preview linked knowledge.

SUCCESS CHECK

Another engineer can explain the next step and the evidence supporting it.

Extend the workflow where it matters.

Script Ops

Review before reuse.

Version, check and approve scripts; download approved work or create a TechDeck draft procedure.

Choose it for script governance.

FaultlineLab

Turn experience into practice.

Use reviewed, de-identified training drafts and diagnostic challenges for coaching.

Free with an OperatorOS account.

Script Ops is an eligible companion; it does not execute scripts. FaultlineLab is free. Review operational material before using it for training.

Fit the workflow to your real environment.

TECHDECK OWNS

Service context + evidence

Tickets, recorded configuration, procedures, time, history and reporting.

EXISTING TOOLS HANDLE

Endpoint execution

Keep authorized RMM, monitoring and remote-access tools in their existing roles.

CONNECT DELIBERATELY

Supported boundaries

Use scoped API tokens and signed outbound webhooks. Verify each intended workflow.

Build the record before you need to defend it.

Authorization

Record the request and the approval reference before the change.

Validation

State what was tested, the outcome and what remains unknown.

Execution evidence

Keep the external tool result, technician and timing.

Handoff

Name the unresolved action, owner and next check.

Recommended operating discipline using TechDeck records. It supports accountability; it cannot guarantee legal protection or prove an unrecorded action.

Measure the change in your own operation.

Handoff quality

Records with an owner + next action

Reconstruction effort

Minutes to explain a sampled incident

Verification quality

Closeouts with specific checks + outcomes

Knowledge reuse

Repeat issues linked to reviewed guidance

How long would it take a different engineer to explain yesterday's change?

Agree the baseline, sample and success threshold together. No outcome guarantee is implied.

Start focused. Give the team room to work.

1

TechDeck

Your flagship application

5

Team seats

Included with the stack

1

Eligible companion

Chosen for your organization

Free OperatorOS home base. Monthly billing. Add seats and eligible companions as needed.

Confirm the current quote and any usage charges before activation.

[Review plans →](#)

Prove the fit with a focused 30-day pilot.

WEEK 1

SET THE BASELINE

Choose one client and five users. Agree the closeout standard and sample.

WEEKS 2–3

WORK THE FLOW

Link issues to systems. Record attempts, checks, time and handoffs.

WEEK 4

CLOSE THE LOOP

Review evidence quality and reuse. Compare reconstruction time.

Continue when a different engineer can reconstruct sampled work and identify unresolved actions without chasing the original technician.

OperatorOS

THE NEXT CONVERSATION

Bring one ticket you never want to explain twice.

We'll follow the context, the evidence and the handoff—then define a pilot your engineers can judge.

Map your workflow with us →

operatoros.net/for/msps

The questions that make the fit clearer.

“We already have a PSA and RMM.”

Evaluate a narrow service-context and evidence workflow. Keep execution in the existing tools; confirm integration and migration needs before expanding.

“Is this another AI answer box?”

The core pitch is traceable records, exact/text search and reviewed evidence-derived guidance. Semantic search is optional and requires separate activation and acceptance.

“Will it run scripts across our clients?”

No. TechDeck runbooks and Script Ops handoffs are reviewed instructions or downloads. Endpoint execution remains an external, authorized activity.

Capabilities at a glance.

Service

Tickets • assignment • service time

Systems

Configuration items • relationships

Lifecycle

Warranty • renewals • due facts

Resolution

Screened imports • source revisions

Knowledge reuse

Cited KB drafts • source freshness

Evidence

Reports • attachments • audit activity

Customer context

Clients • sites • portal visibility

Network context

Network inventory • IPAM records

Procedures

Versioned docs • review • runbooks

Retrieval

Exact identifiers • full-text search

Recurring work

Appointments • ticket schedules

Connections

Scoped tokens • signed webhooks

Agree the scope. Verify the workflow.

Start here

One client, a reviewed incident sample, recorded system context and an evidence-quality standard.

Verify before relying on it

Portal visibility, exports, intended API/webhook flows and the exact deployed tenant workflow.

Keep outside the pitch

Autonomous remediation, automatic discovery, guaranteed compliance and activated semantic search.

Scenario examples are illustrative. Workflow diagrams are explanatory, not product screenshots.

Product scope reviewed 05 Oct 2026. Validate the selected tenant and connected services before rollout.
